Reflection

1. A Cyanotype is when special paper ~~b~~ reacts to sunlight and turns blue. As we do it on glass too, we put the flowers on the paper, they block the light, and after we washed the paper with water and, it vinegar their shapes stay as light marks on the blue background.

2. The Berger Connection.

When we put the flowers on the paper, it captured one moment when the sunlight hit them. Normally, the flowers would just be there for a short time and then move or change. But the Cyanotype saved the exact moment on the paper. The shapes & shadows of the flowers stayed there even after we removed them. It made something temporary become something permanent. Before this, the flowers were just normal objects from nature. After this process, they became a record of that moment in the sunlight. This connects to what John Berger said about capturing a moment.
